

Topic	Video Chat App - SMTP	
Class Description	Student will learn about SMTP and how to send emails with the Gmail account using nodemailer	
Class	C-221	
Class time	45 mins	
Goal	<ul style="list-style-type: none"> Learning about SMTP Sending emails through Gmail using nodemailer 	
Resources Required	<ul style="list-style-type: none"> Teacher Resources: <ul style="list-style-type: none"> Laptop with internet connectivity Earphones with mic Notebook and pen Visual Studio Code Student Resources: <ul style="list-style-type: none"> Laptop with internet connectivity Earphones with mic Notebook and pen Visual Studio Code 	
Class structure	Warm-Up Student-led Activity 1 Wrap-Up	10 mins 30 mins 5 mins
WARM UP SESSION - 10mins		
Teacher Action		Student Action
<i>Hey <student's name>. How are you? It's great to see you! Are you excited to learn something new today?</i>		ESR: Hi, thanks, yes, I am excited about it!

Q&A Session	
Question	Answer
In HTML, which tag is used to insert a line break? A. B. C. <a> D. <d>	B
Node.js runs on -----? A. Client end B. Server -end C. Client-server D. None of the above	B
STUDENT-LED ACTIVITY - 30mins	
Student Initiates Screen Share	
ACTIVITY <ul style="list-style-type: none"> Understanding about WebRTC and it's functions Fetching the audio and the video for the chat app from the user's browser 	
Teacher Action	Student Action
<i>This is a student-led class where all activities should only be performed by the student on the repository that was updated on Render. The teacher is expected to guide the student on the code, explanations and steps.</i>	
In the last class, we completed our Video Chat functionality with the help of sockets, WebRTC and PeerJS.	

<p>We also deployed it on Render and now it is available for anyone to use.</p> <p>In all the video chat applications, such as Google meet, there is one additional functionality which is quite important - To be able to invite others on our video chat app through email!</p> <p>That's what we are going to do in today's class! We will go over how we can send emails to our friends and family to invite them for a video chat through our application!</p> <p>Are you excited?</p> <p>Let's get started then!</p>	<p>ESR: Yes</p>
<p>Do you know which protocol email uses?</p> <p>What is the full form of SMP?</p> <p>That's good! Simple Mail Transfer Protocol is an internet based standard communication protocol for electronic mail transmissions.</p> <p>This protocol is used by all email services out there, including gmail.</p> <p>There are different ports that SMTP can use. Let's understand these ports a bit more -</p> <p>1. 25 - It is primarily used for SMTP relaying. In most</p>	<p>ESR: SMTP</p> <p>ESR: Simple Mail Transfer Protocol</p>

<p>cases, this port <i>should be avoided</i> as it is blocked by residential IPs and Cloud Hosting Providers.</p> <p>2. 465 - IANA (Internet Assigned Number Authorities) has reassigned this port for new services, and it <i>should no longer be used</i>. There are still some old legacy systems that use it.</p> <p>3. 587 - This is the default mail submission port.</p> <p>Therefore it is safe to say that all modern email services working on SMTP use port 587 to send and retrieve digital emails!</p>	
<p>Now, our server is written in NodeJS, and it offers a special library called <i>nodemailer</i> that can be used to send emails from NodeJS using SMTP.</p> <p>Remember, that when we deploy an application on Render by pushing our code there, we are mostly dependent on both <i>package.json</i> file and <i>yarn.lock</i> file to install all the dependencies that we need.</p> <p>Since we are now also needing <i>nodemailer</i> into our application, let's update these 2 files.</p> <p>You can find the code for <i>package.json</i> in Teacher Activity 2 and Student Activity 2.</p> <p><i>Teacher helps the student in copying the package.json code from Student Activity 2</i></p>	<p><i>Student copies the code into package.json from Student Activity 2</i></p>

```

  }
}
```

Just like how we have **package.json** file, which helps with the **npm install** command to know what packages to install, we have **yarn.lock** that helps with the **yarn install** command to know what exactly needs to be installed.

Both of these commands do the same thing, but **yarn install** is much more efficient than **npm install**, and it is important that we also update the **yarn.lock** file. Let's do that -

    "@types/qs" "*"
```

Now, we can be certain that the **nodemailer** will be installed on the server when we deploy it to Render!

Next, let's start writing some code!

In our **server.js**, we will first want to **require()** nodemailer -

Teacher helps the student in writing the code

Student writes the code

```
const { ExpressPeerServer } = require("peer");  
const peerServer = ExpressPeerServer(server, {  
  debug: true,  
});  
  
app.use("/peerjs", peerServer);  
  
var nodemailer = require('nodemailer');
```

With the help of **nodemailer**, you can create a **transporter** that can be used to transport emails on someone's behalf automatically.

Let's write the code to create a transporter for our mailer -

Teacher helps the student in writing the code

Student opens the file

```
const transporter = nodemailer.createTransport({  
  port: 587,  
  host: "smtp.gmail.com",  
  auth: {  
    user: 'apoorv.goyal@whitehatjr.com',  
    pass: '',  
  },  
  secure: true,  
});
```

In this, we have created a **constant** called **transporter**, in which we are calling the **nodemailer.createTransport()** function.

Inside this function, we are passing an object with some data containing -

1. **port** - Port number that it should use - 587
2. **host** - **smtp.gmail.com** for Gmail's SMTP
3. **auth** - That contains a **user** and a **pass** for email ID and password through which it should send an email
4. **secure** - true, to send encrypted emails

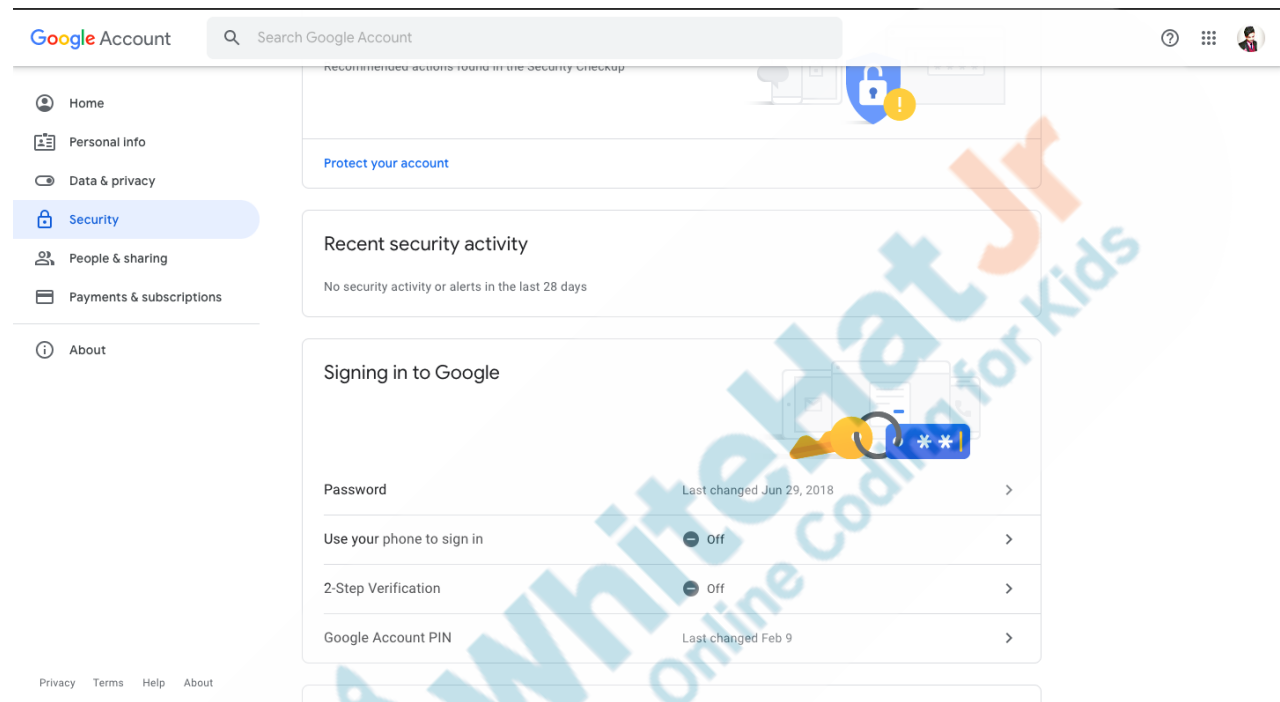

Now, we can use our email here, but what about the password?

It will not accept our regular gmail password, due to security reasons, so what google offers is **app passwords**.

If we are creating an application that is using any of Google's services, google offers this creative password solution with **app passwords**. It helps us generate passwords that can be used in our apps to access google services, and since **gmail** is a google service, we would need to create an app password.

Teacher refers to [Teacher Activity 4](#) and opens it in a new tab

Student refers to [Student Activity 4](#) and opens it in a new tab

In the **Signing in to Google** section, you will need to ensure that your **2-Step Verification** is turned on.

Teacher helps the student in following the steps to turn on **2-Step Verification**

Student turns on **2-Step Verification**

Once done, you will notice that there is another option visible now, called **App Passwords**. Click on it -

Signing in to Google

Password	Last changed Feb 9	>
2-Step Verification	<input checked="" type="checkbox"/> On	>
App passwords	1 password	>

Click on App Passwords -

← App passwords

App passwords let you sign in to your Google Account from apps on devices that don't support 2-Step Verification. You'll only need to enter it once so you don't need to remember it. [Learn more](#)

Your app passwords

Name	Created	Last used
Mail on my Mac	Sep 20	Sep 20

Select the app and device you want to generate the app password for.

Select app

Select device

GENERATE

Here, select **Mail** in the app and Mac (or Windows) for your device

Teacher guides the student

Student follows the instructions

← App passwords

App passwords let you sign in to your Google Account from apps on devices that don't support 2-Step Verification. You'll only need to enter it once so you don't need to remember it. [Learn more](#)

Your app passwords

Windows Computer

Other (Custom name)

GENERATE

Click on **Generate** button and you will see your password -

← App passwords

Generated app password

Your app password for Mac

xsud osfn zmnd kvbq

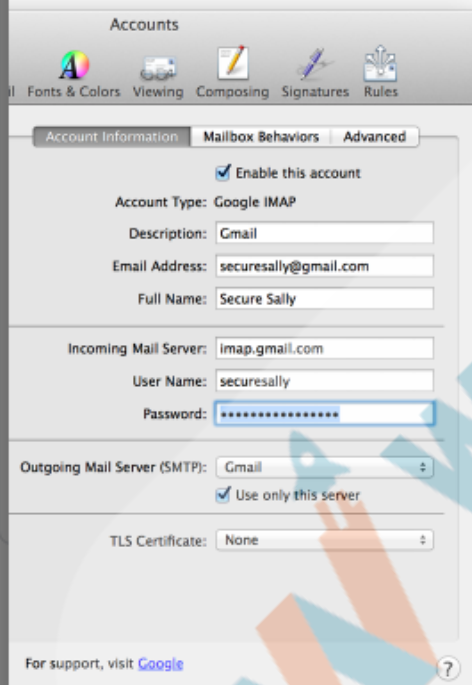

How to use it

1. Open the "Mail" app on your Mac computer.
2. From the Menu bar, select "Mail" → "Preferences..." → "Accounts".
3. Select your Google Account from the list.
4. Replace your password with the 16-character password shown above.

Just like your normal password, this app password grants complete access to your Google Account. You won't need to remember it, so don't write it down or share it with anyone.

[Learn more](#)

DONE

Great! Now, this password can be copied, and pasted into the **pass** in our transporter's code so that it can work!

Teacher guides the student in writing the code

Student follows the instructions

```
const transporter = nodemailer.createTransport({
  port: 587,
  host: "smtp.gmail.com",
  auth: {
    user: 'apoorv.goyal@whitehatjr.com',
    pass: 'xsudosfnzmqndkvbg',
  },
  secure: true,
});
```

We are almost near! Now, we need to create an API, that can receive a **POST** request from the client with the room's **URL** and **To** (the email id of the person we want to send the invite to) data.

Teacher helps the student in writing the code

Student writes the code

```
app.get("/:room", (req, res) => {
  res.render("index", { roomId: req.params.room });
});

app.post("/send-mail", (req, res) => {
  const to = req.body.to;
  const url = req.body.url;
});
```

Do note that we are creating a **post** request with **app.post()** function.

Student writes the code

Next, we need to create an object with all the email's data -

Teacher helps the student in writing the code

```
app.post("/send-mail", (req, res) => {
  const to = req.body.to;
  const url = req.body.url;
  const mailData = {
    from: "apoorv.goyal@whitehatjr.com",
    to: to,
    subject: "Join the video chat with me!",
    html: `

Hey there,</p><p>Come and join me for a video chat here - ${url}</p>`
  };
})

```

Here, in this object, we are setting the **“from”** to our email ID, **“to”** to the **email id** of the receiver, **subject** to **“Join the video chat with me!”**, which would be the subject of our email, and **“html”** to the html we want to send in the email. That's right, we can send HTML in the email as well! This HTML also contains the URL that the user needs to click on to join our room!

Lastly, we will use the **sendMail()** function of the **transporter** we created earlier to send the email based on the object **mailData** that we created -

Teacher helps the student in writing the code

Student writes the code

```
app.post("/send-mail", (req, res) => {
  const to = req.body.to;
  const url = req.body.url;
  const mailData = {
    from: "apoorv.goyal@whitehatjr.com",
    to: to,
    subject: "Join the video chat with me!",
    html: `<p>Hey there,</p><p>Come and join me for a video chat here - ${url}</p>`
  };
  transporter.sendMail(mailData, (error, info) => {
    if (error) {
      return console.log(error);
    }
    res.status(200).send({ message: "Invitation sent!", message_id: info.messageId });
  });
});
```

Here, we are using the **transporter.sendMail()** to send the email with our **mailData** as it's first argument, and we have an arrow function to handle success and errors!

Inside the function, **if** we have an **error**, then we are logging the error to the console for now, else we are sending a **response** with **res**, whose status code will be **200**, letting the client know that the Invitation is sent!

We are halfway through our email invitation functionality! In the next class, we will be completing this app by connecting our API with our client side, and test the functionality too!

Teacher Guides Student to Stop Screen Share
